Test 1 for Probability Theory (Module Signals and Uncertainty, 201800138)

Thursday May 7, 2020, 8.45-10.15 hour.
This test consists of 4 problems and 1 table (P.T.O.)
Use proper notation and motivate all answers.

## Integrity statement

Please read the following paragraph carefully, copy the text below it verbatim to the first page of your work (handwritten) and sign it. If you fail to do so, your test will not be graded.
By testing you remotely in this fashion, we express our trust that you will adhere to the ethical standard of behaviour expected of you. This means that we trust you to answer the questions and perform the assignments in this test to the best of your own ability, without seeking or accepting the help of any source that is not explicitly allowed by the conditions of this test.
The only allowed sources for this test are:

- the book Introduction to Probability Models by Ross (hardcopy or pdf)
- the slides (printed or pdf)
- electronic devices, but only to be used:
- for downloading the test and afterwards uploading your work to Canvas
- to show the test/book/slides on your screen
- to write the test (in case you prefer to use a tablet instead of paper to write on)

Text to be copied (handwritten) and signed:
I will make this test to the best of my own ability, without seeking or accepting the help of any source not explicitly allowed by the conditions of the test.

## Exercises

1. Consider an urn with eight balls, numbered $1, \ldots, 8$. We draw six balls from the urn without replacement and are interested in the event that the fifth ball drawn has number 7 or 8 .
a. Give a proper probability space $(S, P)$ corresponding to this experiment, and specify the subset $A \subset S$ corresponding to the event of interest.
b. Determine the probability of the event of interest via counting (using the definition of Laplace).
c. Determine the same probability in some other way.
d. Is the event of interest independent of the event that the fifth ball drawn has an even number?
2. Consider three coins, $i=1,2,3$, with respective probabilities of heads coming up (when flipped) given by $p_{1}=\frac{1}{4}, p_{2}=\frac{1}{2}$ and $p_{3}=\frac{3}{4}$. We select a coin at random and then flip the selected coin three times.
a. Assuming that the outcome is HHT (i.e. first two times heads, followed by one time tails), determine the probability that the selected coin was the fair coin (i.e., coin number 2).
b. Determine the probability of the outcome being HHT, given that the selected coin was not the fair coin.

In another experiment we flip coin 1 until heads comes up for the second time. Let the random variable $Y$ be the number of coin flips needed.
c. Give the range and expectation of $Y$.
d. Determine the probability that the first time heads comes up in this experiment, is after $i$ coin flips (i.e., at the $(i+1)$ st coin flip or later), $i=1,2, \ldots$.
3. The random variable $X$ has an exponential distribution with parameter $\lambda$.
a. Determine $P(-2<X<3)$.
b. Determine $E(2 X+3)$ and $\operatorname{Var}(2 X+3)$.
c. Determine the probability density of the random variable $2 X+3$.
4. The random variable $X$ has a normal distribution with parameters $\mu=4$ and $\sigma^{2}=25$.
a. Determine $P(-2<X<4)$.
b. Determine $P\left(X^{2}-2 X>8\right)$.

## Tab-1

## Standard normal probabilities

The table gives the distribution function $\Phi$ for a $\mathrm{N}(0,1)$-variable $Z$

$$
\Phi(z)=P(Z \leq z)=\frac{1}{\sqrt{2 \pi}} \int_{-\infty}^{z} e^{-\frac{x^{2}}{2}} d x
$$

Last column: $\mathrm{N}(0,1)$-density function ( $z$ in 1 dec.): $\varphi(z)=\frac{1}{\sqrt{2 \pi}} e^{-\frac{z^{2}}{2}}$

|  | Second decimal of $\mathbf{z}$ |  |  |  |  |  |  |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| $z$ | 0.00 | 0.01 | 0.02 | 0.03 | 0.04 | 0.05 | 0.06 | 0.07 | 0.08 | 0.09 | $\varphi(\mathrm{z})$ |
